

Coordination reorganises without a change in movement amplitude

55 links shifted beyond the person's own repetition variability; range of motion was unchanged in 47 of them

Pooled JcvPCA, exercises 09–13, all retained components · variability floor = repetition 1 vs 2 at baseline · four single-case series, descriptive

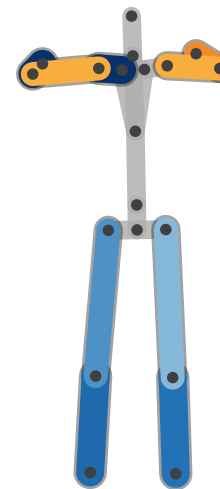

Participant 671
8 of 18 links above floor

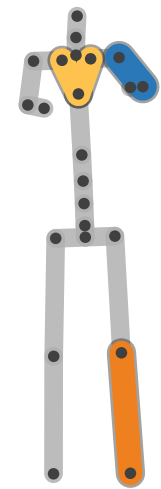

Participant 252
4 of 22 links above floor

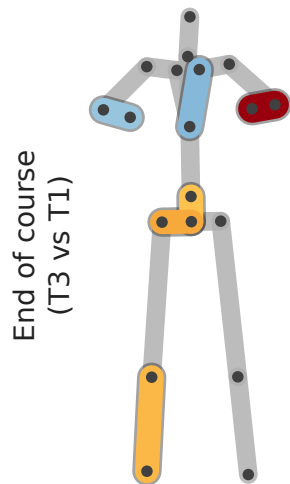

Participant 651
9 of 18 links above floor

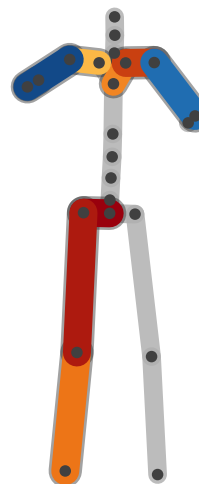

Participant 790
4 of 22 links above floor

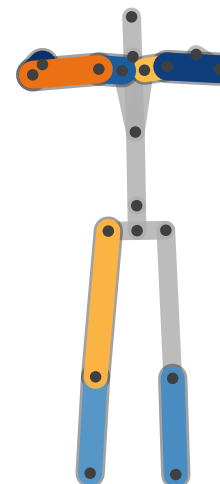

Participant 671
6 of 18 links above floor

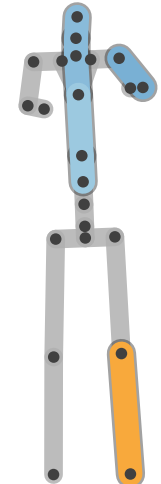

Participant 252
9 of 22 links above floor

Participant 651
8 of 18 links above floor

Participant 790
7 of 22 links above floor

Coordination change, in multiples of the person's own repetition variability

1x = the link's coordination changed as much as it already differed between the two baseline repetitions. 3x = three times that, where the scale is capped.

Above the floor: 31 links strengthened, 24 weakened. Each component is weighted by the variance it explains, so low-variance components cannot drive the result.
